21 GML, Interoperability, and Standards: TGML: extending GML by temporal constructs - a proposal for a spatiotemporal framework in XML

Alexander Zipf, Sven Krüger

November 2001 **Proceedings of the 9th ACM international symposium on Advances in geographic information systems**

Publisher: ACM Press

Full text available: 📄 pdf(1.75 MB)   Additional Information: full citation, abstract, references, index terms

> XML is nowadays a commonly used way for describing and exchanging data. Within the GIS community the OpenGIS Consortium (OGC) recently has published the Geographic Markup Language (GML) as a new specification [8]. GML is essentially an XML encoding of the Simple Feature Specification (SFS). A range of further XML-based standardization efforts by the OGC are under development right now. But it is known that spatial features do not only have geometric or thematic properties, but also temporal aspe ...

1. **Active hypertext for distributed Web applications**

Koppen, E.; Neumann, G.;
Enabling Technologies: Infrastructure for Collaborative Enterprises, 1999. (WET ICE '99) Proceedings.
IEEE 8th International Workshops on
16-18 June 1999 Page(s):297 - 302

Abstract:

The prevailing architecture for Web-based applications relies on HTML, HTTP and loosely integrated functional elements, propagating a strong distinction between client and server. The proposed approach for active hypertext documents however realizes applications through hypertext documents with embedded application logic. Furthermore, the need for separating the approach into a model, a development method and supporting tools is identified. The core model is based on open standards such as XML and CSS. It is extended by idioms which describe important concepts and reusable constructs. Examples for the application of the model are given
